

riva star

tooth desensitising agent
and cavity cleanser

Biofilm + sensitivity eliminator

A **STAR** product containing three powerful components:

r i v a s t a r

1

SILVER Ag^+

2

IODIDE I^-

3

FLUORIDE F^-

Together, these have a powerful effect to provide instantaneous relief to hypersensitivity.

Triple-innovators

Riva Star was designed by three renowned Australian clinicians, bringing together their clinical knowledge and experience of using these three exceptional components, and combining them into one STAR product – Riva Star.

BIOFILM ELIMINATOR

Riva Star - Two years and beyond desensitising effect

Clinical studies support the immediate effect of Riva Star and its long term effect of over two years⁷.

Riva Star - Antibacterial activity

Riva Star is an effective biofilm inhibitor. This is supported by study results from Otago University (NZ), that Riva Star has a higher inhibition zone against four bacterial species compared to sodium hypochlorite.

Antimicrobial activity of NaClO and SDF/KI against Endodontic pathogens⁸

Agar plate cultured with *S. mutans*

- Assists in the elimination of biofilm¹⁻³
- Inhibits biofilm formation¹⁻³
- May assist in the alleviation of caries⁴

Riva Star - Non-invasive

Riva Star is essential for clinicians practising Minimally Invasive Dentistry (MID)^{1-3,5}. It conditions dentine and may assist tooth preservation.

Riva Star - Increasing bond strengths of GICs

Pre-treating tooth surfaces with Riva Star is a great way to enhance bonding of glass ionomers to dentine⁶.

Riva Star - Patented procedure

Unlike other silver fluoride systems, Riva Star's two step patented procedure minimises the risk of staining. By applying the potassium iodide solution over the silver fluoride, a silver iodide creamy white precipitate is formed and washed off.

Riva Star - No Staining

Riva Star - Detecting Caries

Ideal for detecting caries in its earliest stage.

Riva Star - Indications

- Desensitising cervical tooth hypersensitivity.
- Cavity cleansing
- Detecting Caries

riva star instructions:

1. Clean teeth with prophy paste and isolate area with cotton rolls.

2. Dry area and apply a small amount of gingival barrier to adjacent tissue.

3. Light cure in a fanning motion.

4. Using silver brush, pierce foil on silver capsule.

5. In circular motion, push foil to the edge of the opening.

6. Carefully apply solution from silver capsule to treatment site only.

8. In circular motion, push foil to the edge of the opening.

10. Blot dry, remove gingival barrier.

7. **Immediately** using green brush, pierce foil on green capsule.

9. Apply generous amount of solution from green capsule to treatment site. Keep applying until creamy white turns clear.

CAUTION:

The material could stain teeth if incorrectly used. Patient must be informed of this risk prior to its use.

Each pair of capsules (green and silver) can treat up to 5 teeth on a patient.
