THE DENTAL
ADVISOR
++++^{1/2}

The Dental Advisor.
October 1998,
Vol. 15, No. 8.

For use in just about every restoration

- | | |
|--|--|
| • Class V restorations | • Temporary crowns |
| • Tunnel / air abrasion preparations | • Cement porcelain/ceramic/
composite veneers |
| • Pit and fissure sealants | • Splint mobile teeth |
| • Minimal Class I, II, III, IV
restorations | • Attach fiber bridges |
| • Radiopaque cavity liners | • Restorations in deciduous teeth |
| • Cervical abrasion/erosion lesions | • Repair porcelain restorations |
| • Abfraction lesions | • Block out undercuts in
inlay/onlay/crown preparations |
| • Implant seals | • Cover stains |
| • Incisal abrasions | • Adhering tooth jewelry |
| • Repair enamel defects | • Ceramic inserts |
| • Minor core build-ups | |

A choice of 3 viscosities

Flow at 90° angle for 2 minutes

The wide number of viscosities available in the Wave range ensures the clinician has a choice for all different clinical conditions.

SDI Flowable: Compare to:

Wave	UltraSeal XT Plus* Premise Flowable*
Wave MV	Filtek Supreme Plus Flowable* Heliomolar Flow* Tetric Flow*
Wave HV	Revolution Formula 2* Flow-It! ALC* Point 4 Flowable* Filtek Flow* AeliteFlo LV* Esthet-X Flow* AeliteFlo*

Nanofilled

Wave, Wave MV and Wave HV contain specially treated nano-fillers to maximize polishability, wear resistance and strength. Ease of extrusion is improved with the addition of these specially treated nano-fillers.

Filler loading

Wave, Wave MV and Wave HV all have excellent wear profiles due to their high filler loading level:

Fluoride release

Fluoride's cariostatic effect enhances remineralization and inhibits enamel demineralization. In an aqueous environment, the fluoride ions in Wave, Wave MV and Wave HV diffuse from the resin into the surrounding tooth. This ionic movement is caused by oral fluid passing in and out of the resin and tooth, acting as a carrier for the fluoride ions.

Natural fluorescence

Wave, Wave MV and Wave HV contain a fluorescent agent that ensures perfectly natural looking teeth under ultraviolet lights. No one will know!

Wave on natural teeth under UV light

Radiopacity

Wave, Wave MV and Wave HV are all visible on x-rays. This allows easy identification of secondary caries at the interface.

Compressive strength

Wave's, Wave MV's and Wave HV's high compressive strength values expand the suitability for multiple applications.

MPa @ 1 hour**

UDMA

Wave's UDMA resin system minimizes shrinkage and reduces post operative sensitivity.

Specialty shades

Wave's 14 shades are ideal for all anterior and posterior restorations: A1, A2, A3, A3.5, B1, B2, B3, C2, C3, D3, OA2, incisal, gingival and bleach. Gingival shade is ideal for restoring cervical lesions in elderly patients. For teeth lighter than B1, Bleach shade is available. A semi-translucent shade, Incisal, is perfect as a final layer for composite restorations.

Tip length comparison

Wave's complet tip length is 12.2mm, 40% longer than the alternative of 8.7mm. Wave's longer tip length allows more direct placement of the material into difficult to reach areas.

instructions:

- 1 Clean and isolate tooth
- 2 Remove excess water. Preferably keep moist, but a dry surface is ok
- 3 Apply Go! to saturate all internal surfaces and leave in place for 20 seconds. Or, apply other bonding agent according to manufacturer's instructions

- 4 Blow firmly with dry, oil free air for 5 seconds. Leave surface glossy

- 5 Light cure for 10 seconds

- 6 Directly inject Wave in increments of 2mm or less in:

- 6.1 Class V restorations or

- 6.2 Tunnel preparations or

- 6.3 Pit and fissure sealants or

- 6.4 Minimal Class I, Class II, Class III and Class IV restorations, or other indications as required

- 7 Cure Wave for 20 seconds in increments of 2mm

- 8 Polish and finish
